

η

$$I^G(J^{PC}) = 0^+(0^{-+})$$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** (1988).

η MASS

The new measurements from CLEO-c and KLOE seem to resolve the obvious inconsistency of the previously available high-precision η mass measurements by NA48 (LAI 02) and GEM (ABDEL-BARY 05) in favor of the higher η mass from NA48. Therefore we now use only the results from LAI 02, MILLER 07, and AMBROSINO 07B for our η mass average.

[*a*] Due to removing an old measurement from the average, this is 0.11 keV larger than the width we gave in our 2002 edition, 1.18 ± 0.11 keV. See the $\Gamma(2\gamma)$ data block in the Data Listings.

[*b*] *C* parity forbids this to occur as a single-photon process.

CONSTRAINED FIT INFORMATION

An overall fit to a decay rate and 20 branching ratios uses 49 measurements and one constraint to determine 9 parameters. The overall fit has a $\chi^2 = 50.9$ for 41 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

η DECAY RATES

$\Gamma(2\gamma)$

Γ_2

See the table immediately above giving the fitted decay rates. Following the advice of NEFKENS 02, we have removed the Primakoff-effect measurement from the average. See also the “Note on the Decay Width $\Gamma(\eta \rightarrow \gamma\gamma)$,” in our 1994 edition, Phys. Rev. D**50**, 1 August 1994, Part I, p. 1451, for a discussion of the various measurements.

VALUE (keV)	EVTS	DOCUMENT ID	TECN	COMMENT

0.51 $\pm 0.12 \pm 0.05$	36	BARU	90	MD1 $e^+ e^- \rightarrow e^+ e^- \eta$
0.490 $\pm 0.010 \pm 0.048$	2287	ROE	90	ASP $e^+ e^- \rightarrow e^+ e^- \eta$
0.514 $\pm 0.017 \pm 0.035$	1295	WILLIAMS	88	CBAL $e^+ e^- \rightarrow e^+ e^- \eta$
0.53 $\pm 0.04 \pm 0.04$		BARTEL	85E	JADE $e^+ e^- \rightarrow e^+ e^- \eta$

• • • We do not use the following data for averages, fits, limits, etc. • • •

0.64 ± 0.14	± 0.13	AIHARA	86	TPC	$e^+ e^- \rightarrow e^+ e^- \eta$
0.56 ± 0.16		WEINSTEIN	83	CBAL	$e^+ e^- \rightarrow e^+ e^- \eta$
0.324 ± 0.046		BROWMAN	74B	CNTR	Primakoff effect
1.00 ± 0.22		² BEMPORAD	67	CNTR	Primakoff effect

² BEMPORAD 67 gives $\Gamma(2\gamma) = 1.21 \pm 0.26$ keV assuming $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.314$.

Bemporad private communication gives $\Gamma(2\gamma)^2/\Gamma(\text{total}) = 0.380 \pm 0.083$. We evaluate this using $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.38 \pm 0.01$. Not included in average because the uncertainty resulting from the separation of the coulomb and nuclear amplitudes has apparently been underestimated.

3.20 ± 1.26	53	18 BASTIEN	62	HBC
2.5 ± 1.0	10	18 PICKUP	62	HBC

18 These experiments are not used in the averages as they do not separate clearly $\eta \rightarrow \pi^+ \pi^- \pi^0$ and $\eta \rightarrow \pi^+ \pi^- \gamma$ from each other. The reported values thus probably contain some unknown fraction of $\eta \rightarrow \pi^+ \pi^- \gamma$.

$$\Gamma(2\gamma) / [\Gamma(\pi^+ \pi^- \pi^0) + \Gamma(\pi^+ \pi^- \gamma) + \Gamma(e^+ e^- \gamma)] \quad \Gamma_2 / (\Gamma_9 + \Gamma_{10} + \Gamma_{11})$$
